

## Oil and Water Experiment

This is a great Science experiment you could try out at home.

You will need:

- Oils (Baby Oil)
- Water
- Food Colouring
- Pipettes
- Cups/Bowls
- A pie pan or similar

1. Fill a shallow dish with oil
2. In a cup combine 3-5 drops of food colouring with water and mix, using one cup for each colour
3. With the pipettes, squirt the different colours into the pan of oil
4. What Happens? The water and oil do not mix and instead, amazing effects are produced, no matter how much water is added to the oil, the 2 liquids will not mix

You could also try with water colours in the pipettes and observe the reaction and effect.
